

## THE INVENTION

PROTECT REVOLUTION® rodenticide granule is a revolutionary new bait system offering the rodents a poisoned bait and an appetizing gel, which serves as a source of drinking water, at the same time.

The use of the product reduces the rodents' reluctance against poisoned bait, and considerably increases the consumption of poisoned bait, thus rat infestation can be eliminated faster and more efficiently.

## DID YOU KNOW?

For people, shank and beer or roast duck and red wine are inseparable. In the background, you may find both cultural traditions but mostly the simple physiological phenomenon that - for humans and animals - appropriate intake of liquid helps swallowing and digestion of the food as well as allows the dissolution and absorption of nutritive substances.

# THE LAST SUPPER

Lethal combination

Extremely effective

Simple application

Safe placement

## RODENCIDE BAIT SYSTEM

## A REVOLUTIONARY NEW INVENTION

## THE PROBLEM

It is relatively simple to detect the appearance of rodents in or around our habitations through their various damages, unpleasant odour and/or traces of droppings. It is difficult to determine the number of settled individuals as they mostly feed in dark and stay in their nest during the day. The control is foredoomed to failure when we try to eliminate the infestation using less rodenticides than required, while the exaggerated use of poisoned baits will lead to an unnecessary increase of the costs of control.

Being cautious of every new and unfamiliar object (neophobia) – including food and human activities – is an essential element of the rats' survival strategy. In practice, this means that they do not start eating the placed out rodenticide at all – or only eat very low quantity –, and if they perceive any suspicious sign, they will not consume the offered poisoned bait.

As water is indispensable for rats, they can survive longer without food than without water. Just like people, rats can consume more food if meanwhile they can drink too. In human environments the rats have more problems to find free source of water than to get food, and the two are quite rare to be found at the same place. However, if they have access to both water and food at the same time over the same area, their cautiousness in the everyday struggle for survival shall abate.

## Aroma permeable foil

## Appetizing gel

## Rodenticide bait

## THE SOLUTION

PROTECT REVOLUTION® rodenticide granule contains Bromadiolone active substance which is an up-to-date second generation anticoagulant. The delayed action of the active substance prevents the rodents from connecting the consumption of the bait with the poisoning symptoms. In addition to the rodenticide, this revolutionary new product also contains a so-called appetizing gel that provides a source of drink for the rats. The combined/simultaneous presence of the food and the gel incites the rodents to stay nearby, start consuming the poisoned bait sooner and consume more rodenticide within a shorter time.

PROTECT REVOLUTION® rodenticide granule comes in the innovative aroma permeable packaging developed by BÁBOLNA BIO. This novel packaging allows the safe „no-touch“ application of the rodenticide without derogating the acceptance of the bait. In addition, the use of the special bait tray permits to determine without doubt –by the signs of foil opening and bait consumption by the rats – whether the first and most important step of the control strategy, overcoming the neophobia, has been taken.

## THE APPLICATION

Remove the grey aluminium foil before application so that the rodents have direct access to the appetizing gel which does not contain active substance. Leave the white aroma permeable foil on the tray as this allows rats to find and gnaw the foil and consume the bait without opening. Due to the special packaging of the product, you may apply the rodenticide safely, without even touching it. If the permeable foil is gnawed, you may be sure that rats have found and consumed from the bait. During a prolonged application of the tray, the appetizing may shrink as a result of evaporation. In such case, the gel may be re-swelled a few times by adding some water. Prevent water from getting in contact with the bait or the aroma permeable foil.
